HTML and CSS Website Lab

(1 point awarded by default)

Time target: max 60 minutes

Theme: Student Volunteer Club - "Campus Connect"

Project brief:

A student volunteer club needs a small, responsive website that introduces its work and helps students find activities and contact the team. Build the site using HTML5 and an external CSS file only. Do not use JavaScript, Bootstrap, or other frameworks.

Exercise 1: HTML structure and navigation (3 points)

Files: index.html, about.html, events.html, contact.html

- Create four valid HTML5 pages with a meaningful title, UTF-8 charset, and viewport meta tag.
- Use one <header>, <main>, and <footer> on every page.
- Add a site name and relative navigation links to all four pages.
- Mark the current navigation link on each page with class="active" and aria-current="page".
- Use a logical heading order and appropriate semantic elements, including <section> and <article> where relevant.
- Add useful alt text to each content image. Decorative images may use an empty alt attribute.

Exercise 2: Page content (3 points)

Files: index.html, about.html, events.html, contact.html

- On the home page, add a welcome section and three activity cards. Each card has a heading, a short description, and a link to a relevant page.
- On the about page, describe the club's purpose and include a short section about its members or values.
- On the events page, add three upcoming activities. Each activity includes a title, date, and concise description.
- On the contact page, show the club's contact details and add a form with labelled name and email fields, a topic select, a message textarea, a required consent checkbox, and a submit button.
- Use native HTML validation attributes where appropriate. The form is a static interface and does not need to send data.

Exercise 3: External CSS and responsive layout (3 points)

File: css/style.css

- Link the same external stylesheet from all four pages. Do not use inline styles or <style> elements.
- Create a consistent color palette, typography, spacing, header, navigation, footer, and visible keyboard focus states.
- Use CSS variables for repeated colors and spacing values.
- Arrange the three activity cards with CSS Grid or Flexbox. Add a hover effect with a transition.
- Add at least one media query so the navigation and cards remain usable on narrow screens.
- Use readable contrast and keep text and images within the viewport at small widths.
- Do not include JavaScript, Bootstrap, or another CSS framework.
